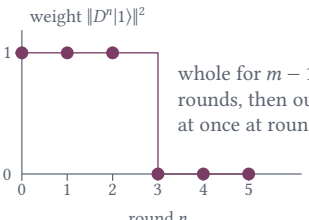
(a) $K_{n+1} = \Phi(K_n)$, *with* $\Phi(K) = \ker B \cap D^{-1}K$

Φ changes nothing

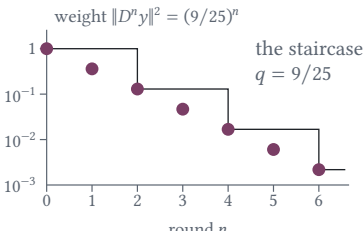
K_n holds the vectors with no exit in their first n rounds; at most m strict steps

(b) the cycle body, $m = 3$



whole for $m - 1 = 2$ rounds, then out at once at round 3

(c) the flip, $m = 2$ *(log scale)*



the staircase $q^{2\lfloor n/m \rfloor}$, $q = 9/25$
