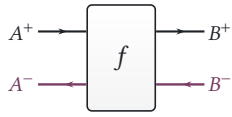
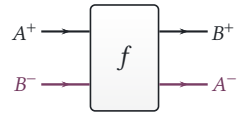
(a) a morphism of $\mathrm{Int}(\mathscr{C})$ *is a unitary of* $\mathscr{C}$



is



what enters on the right in $\mathrm{Int}(\mathscr{C})$ is an input of the unitary, and what leaves on the left is an output

$f : (A^+, A^-) \to (B^+, B^-)$ $\qquad$ $f : A^+ \oplus B^- \to B^+ \oplus A^-$ in $\mathscr{C}$

(b) the unit η_{NY}*: a U-turn at the start*

$\eta_{NY} : (0,0) \to (-Y) \oplus NY = (Y, Y)$
in $\mathscr{C}$: $\mathrm{id}_Y : 0 \oplus Y \to Y \oplus 0$

(c) the counit ε_{NY}*: a U-turn at the end*

$\varepsilon_{NY} : NY \oplus (-Y) = (Y, Y) \to (0,0)$
in $\mathscr{C}$: $\mathrm{id}_Y : Y \oplus 0 \to 0 \oplus Y$
